

This file is for Purely EXEC mode, no GUI

The executables are stored at "PhotoCryX/EXEC", which are

- mpb_1d
- mpb_hx
- mpb_sq
- mpb_vy

The mandatory files are "mpb.in" and the GDSII file

Here we discuss a honeycomb lattice with the GDSII file "dumbell.gds" in the "TEST/hex" folder

```
cd ~/Downloads/PhotoCryX/PhotoCryX/TEST/hex
```

Initially, we export the executables to the path

```
export PATH=~/Downloads/PhotoCryX/PhotoCryX/EXEC:$PATH
```

This can be added to bash as well

Here, as the hexagonal and honeycomb possess the same reciprocal vectors, the executable is "mpb_hx"

Edit the master control file "mpb.in" if needed and then execute

```
mpb_hx
```

This executes and plots all necessary images in the
"~/Downloads/PhotoCryX/PhotoCryX/TEST/hex" directory

If needed, the TEST/hex folder may be copied to some other location
