

PhotoCryX is a free and open-source tkinter-based graphical user interface (GUI) for MIT photonic bands (MPB) to compute band structures of photonic crystals

Features

- Free and open-source under the GNU General Public License v2.0
- GUI is based on the tkinter package
- Exclusively designed for the computation of band structures in Photonic Crystals

- Currently, the photonic crystals included are
 - 1D Photonic Crystals
 - 2D Photonic Crystals
 - Square Lattice
 - Hexagonal Lattice
 - Honeycomb Lattice
 - 3D Photonic Crystals
 - Simple Cubic Lattice
 - Body-centred cubic (BCC) Lattice
 - Face-centred cubic (FCC) Lattice
 - Diamond Lattice
- Standard lattices with cylinders and spheres can be dynamically modified
- Any complex 2D lattice can be modelled from the GDSII structure import
- 3D visualization using Vis5d and Mayavi is included

File Description

File	Description
Installation.md	Installation instructions using conda
PhotoCryX.zip	Source code
README.md	General Readme file
photocryx.png	PhotoCryX Icon

Installation

Follow the installation steps given [here](#)

(The steps include installing some additional packages apart from the standard MEEP installation given [here](#))
